Science is the difference.

The journey does not yet prove it.

KatKin has capital, scale claims, fresh-food conviction and scientific ambition. Public evidence does not reveal acquisition economics, transition completion or retained-feeder value.

FOUNDER DECISION

Decide whether to commission baseline measurement of trial, transition and retention before scaling spend.

Turn science into a decision system customers can use.

QUALIFIED TRIAL × TRANSITION × EARLY CONFIDENCE × RETENTION

A measurable growth relationship — not a financial forecast.

Replace every term with first-party baselines; test the sequence; scale only what improves durable customer value.

Four levers. One order of operations.

01	**QUALIFY**	Help the right cat parent decide whether fresh feeding fits.
02	**TRANSITION**	Make the switch explicit, supported and measurable.
03	**RECOGNISE**	Show owners what useful early progress looks like.
04	**RETAIN**	Use evidence and guidance to sustain committed feeding.

The committed cat parent at the trial decision

Not the broadest pet audience: the owner willing to change behaviour, but needing confidence that the change is justified and manageable.

EVIDENCE REQUIRED

Validate transition friction, reasons for cancellation and retained value before further acquisition spend.

MAKE SCIENCE USABLE.

Build and test a customer-facing decision system across trial, transition and early feeding before expanding brand or acquisition investment.

THE TRADE-OFF

This diverts investment from pure acquisition marketing and depends on first-party cohort data that does not yet exist. It also requires independent verification of the K3 study before it can carry the weight of a decision system.

MATT APPROVAL REQUIRED BEFORE FULL FIELDWORK PRODUCTION
